

Mathematics Syllabus, Grades 9

Introduction

The curriculum guide for grade 9 is a continuation of the syllabi of mathematics of the preceding grades and is based on the knowledge acquired and competencies developed by students in their mathematics study of the earlier grades. Mathematics learning in grade 9 has to be performed in such a way that students' interest in the subject is stimulated. This can be done by connecting the lesson in the classroom with real life and theory with practice by using students' experience gained from their environment and other subjects. Interesting problems concerning the broad

application of mathematics in agriculture, industrial arts, trade, production, investment, the other sciences, etc. should be used.

While planning, the teacher the teacher should always look for hands-on, minds-on and interesting activities that can motivate students to study the subject. Learning has to be facilitated by the teacher in such a way that new subject matter is linked with deepening of the already acquired knowledge and developed abilities and skills.

Objectives

After completing grade 9 mathematics, students should be able to

- deal with and perform the four operations using the set of real numbers.
- solve linear and quadratic equations.
- use basic knowledge about sets to solve related problems.
- develop basic knowledge about relations, functions and their respective graphs.
- know important properties of regular polygons and use the properties to solve related problems.
- use postulates and theorems on congruent and similar figures and solve related real life problems.
- solve real-life problems on height, distance and angle using their knowledge and skills in trigonometry.
- use symmetrical and angle properties of circles to solve related problems.
- calculate are lengths perimeters and areas of segments and sectors
- calculate areas of triangular and parallelogram regions.
- calculate surface areas and volumes of cylinders and prisms.
- collect, tabulate, draw histograms and calculate measures of location and measures of dispersion for ungrouped statistical data.
- calculate probability of an event.
- identify vector and scalar quantities.
- represent vectors pictorially.
- determine the sum of vectors and multiply a given vector by a scalar.
- express any given vector as a position vector.

Unit 1: The Number System (33 periods)

Unit outcomes: Students will be able to:

- Know basic concepts and important facts about real numbers
- Justify methods and procedures in computation with real numbers
- Solve mathematical problems involving real numbers.

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|--|---|--|--|
| <p><i>Students will be able to:</i></p> <ul style="list-style-type: none"> • identify natural numbers and integers • define prime numbers and composite numbers • determine common factors and common multiples of pairs of numbers. • show that repeating decimals are also rational numbers • identify irrational numbers • locate some irrational numbers on a number line. • define real numbers. • describe the correspondence between real numbers and points on a numbers line. | <p>1. The Number System</p> <p>1.1 Revision on the set of rational Numbers (3 periods)</p> <p>1.1.1 Natural numbers, integers, prime numbers and composite numbers</p> <p>1.1.2 Common factors and common multiples</p> <p>1.2 The real number system (30 periods)</p> <p>1.2.1 Representation of rational numbers by decimals.</p> <p>1.2.2 Irrational numbers</p> <p>1.2.3 Real numbers</p> | <ul style="list-style-type: none"> • You can start the lesson by revising the Natural numbers, integers, prime and composite numbers. • Let students revise prime factorization of composite numbers. • Let students revise on finding common factors and common multiples of given numbers. • Discuss with students about the definition of rational numbers together with their important properties • After a brief discussion of terminating decimals, then with active participation of students discuss on the method of converting repeating decimals to fraction • You can start the learning by discussing the necessity of irrational numbers as an extension of the number system. For example you may ask students to solve equations of the form $x^2 = 3$ • After considering several examples of irrational numbers (expressed in either decimal form or in radical form), encourage students to describe the nature of irrational numbers and then state the definition of irrational number. • Assist students to come to the definition of real numbers in their own words • i.e. real number is the union of rational and irrational numbers and introduce the notation \mathbb{R} of the set of all real numbers. | <ul style="list-style-type: none"> • Turn by turn ask students to tell to the class, what they know about natural numbers, integers, prime numbers, and composite numbers • Asking oral questions • Giving group work exercises' • Giving class activities • Homework and check their work • Assignment • quiz I • Ask students to define rational number and to give their own examples of rational numbers. • Ask students to give their own examples of irrational number and let them justify their answers. • Ask students to give their own examples of real numbers • Give exercises problems on locating a given real |

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|--|---|---|---|
| <ul style="list-style-type: none"> Realize the relationship between a power with fractional exponent and a radical form. Convert powers with fractional exponent to radical form and vice-versa perform any one of the four operation on the set of real numbers use the laws of exponents to simplify expression. | <p>1.2.4 Exponents and radicals</p> <p>1.2.5 The four operations on real numbers.</p> | <ul style="list-style-type: none"> Assist students to locate real number say $\sqrt{2}$ or $\sqrt{2} + 3$ on the number line and describe the correspondence between real numbers and points on the number line. Discuss the relationship between power with fractional exponent form i.e. in which the exponent is $1/n$ when n is a natural number and radical form. Assist students to convert from one form to the other form and encourage them to come to the rule which is stated as $a^{1/n} = \sqrt[n]{a}$ where $a > 0$ and $n \in \mathbb{N}$ You may start the lesson by asking students to perform the four operation on rational numbers; Assist students to perform the same operations on real numbers. i.e. which involves radicals. Let students generalize the commutative and associative properties of addition and multiplication on the set of real numbers Discuss with students the distributive properties of multiplication over addition and discuss also the existence of the additive and multiplicative identities and inverses for every real number (except 0 which has no multiplicative inverse) Let students state the laws of exponents after considering several examples i.e. (1) $a^n \times a^m = a^{n+m}$ (2) $\frac{a^n}{a^m} = a^{n-m}$, ($n > m$) (3) $(a^n)^m = a^{n \times m} = (a^m)^n$ (4) $(a \times b)^n = a^n \times b^n$ | <p>number, say $\sqrt{3}$ or $\sqrt{3} + 2$ on the number line.</p> <ul style="list-style-type: none"> Ask students to describe what is meant by $a^{1/n} = \sqrt[n]{a}$ for different values of n and a <p>e.g. $9^{1/2} = \sqrt{9}$, $8^{1/3} = \sqrt[3]{8}$, $4 \sqrt{725}$, ..</p> <ul style="list-style-type: none"> Give exercise problems on computing with real numbers (i.e., to find the sum, difference, product and quotient of real numbers. Ask students to identify important properties of addition and multiplication of real numbers, i.e. for $a, b, c \in \mathcal{R}$ $a+b=b+a$ and $a \times b = b \times a$ $(a+b)+c=a+(b+c)$ and $(a \times b) \times c = a \times (b \times c)$ $a \times (b+c) = (a \times b) + (a \times c)$ Ask students questions like the following and let them justify their answer by giving their own examples. |

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|--|--|--|--|
| <ul style="list-style-type: none"> give appropriate upper and lower bounds for a given data to a specified accuracy (e.g. rounding off) | <p>1.2.6 Limits of accuracy</p> | <ul style="list-style-type: none"> You may start the lesson by revising some important points on the rational number expressed in decimal numerals (i.e. terminating and repeating decimals). With active participation of students discuss on the idea of "rounding off" and the notion of "significant figures" in a number, in doing so verify the concept using several examples. For example: 4.5, 4.50 and 4.500 although appearing to represent the same number, but do not. This is because they are written in different degree of accuracy, for instance 4.5 is rounded to one decimal place and therefore any numbers from 4.45 up to but not including 4.55 would be rounded to 4.5. On a number line this would be represented as <div style="text-align: center;"> </div> <p>Using in equality this can be expressed as $4.45 \leq 4.5 < 4.55$ the number 4.45 is called the lower bound while 4.55 is known as the upper bound.</p> | <ul style="list-style-type: none"> (1) if a is rational number and b is an irrational numbers, then <ul style="list-style-type: none"> - What type of number is $a + b$? - What type of number is $a \times b$? (2) if both a and b are irrational numbers, then <ul style="list-style-type: none"> - What type of number is $a + b$ - What type of number is $a \times b$ Give exercise problems on simplification powers by using the laws of exponents. Give several exercise problems on rounding off and finding the lower and upper boundaries of number (or measurements). Ask students to find the sum and difference of numbers to a given number of significant figures. |

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|---|--|--|---|
| <ul style="list-style-type: none"> express any positive rational number in its standard form. explain the notion of rationalization. identify a rationalizing factor for a given expression. | <p>1.2.7 Standard form (scientific notation).</p> <p>1.2.8 Rationalization</p> | <ul style="list-style-type: none"> By considering examples like: "A carpenter measures the width (w) of a window rounded off to 2.4m to the nearest one decimal place (or 2 significant figures). What are the minimum and maximum values of the width (w) when rounding off?" Since $2.35 \leq w < 2.45$, the number 2.35 is the lower bound while 2.45 is the upper bound. You may consider the effect of operations (addition, subtraction and multiplication) on accuracy. <p>E.g. The effect of addition on accuracy The two sides of a triangle are 7.6cm and 5.4cm long. Find their sum. Ans. If $l_1 = 7.6\text{cm}$ and $l_2 = 5.4$, then $7.55 \leq l_1 \leq 7.65$ and $5.35 \leq l_2 \leq 5.45$ or $7.6 \pm 0.05\text{cm}$ and 5.4 ± 0.05. Therefore their sum is $(7.6 \pm 0.05) + (5.4 \pm 0.05) = 13.0 \pm 0.1\text{cm}$ and sum lies between 12.9cm and 13.1cm.</p> <p><i>(Note: Care should be taken in the calculations and in the numbers taken, the significant figures not to be more than three (or two decimal places))</i></p> Assist students to practice writing standard notations of positive rational numbers Assist students to recognize that this notation is useful in writing very small and very large positive numbers. With active participating of the students discuss the rules of rationalization with the help of examples, in doing so give emphasis on how to determine the rationalizing factors and also emphasize on rationalizing the denominator as it is commonly used. | <ul style="list-style-type: none"> Ask students to write large numbers like the population of Ethiopia in standard form. Give exercises on expressing large or small numbers by using their standard notation. Give exercise problems on rationalizing a given expression. |

Mathematics: Grade 9

| <i>Competencies</i> | <i>Contents</i> | <i>Teaching / Learning Activities and Resources</i> | <i>Assessment</i> |
|--|---|--|--|
| <ul style="list-style-type: none"> use the Euclid's division algorithm to express given quotients of the form $\frac{p}{q}$ where $p > q$. | <p>1.2.9 Euclid's division algorithms.</p> | <ul style="list-style-type: none"> Assist students to express, state and generalize the Euclid's division algorithm. i.e. given two numbers p and d where $p > d$ the $p = q \cdot d + r$. Where q is the quotient and r is the remainder and $r \geq 0$, in doing so give emphasis on the nature of the numbers, i.e. all p, q, d and r are non-negative integers and $0 \leq r < d$ | <ul style="list-style-type: none"> Give exercise problems on the application of the algorithm e.g. $7 = (2 \times 3) + 1$. |

Unit 2: Solution of Equation (22periods)

Unit outcomes: Students will be able to:

- Solve problems on equations involving exponents and radicals
- Solve systems of simultaneous equations in two variables.
- Solve simple equations involving absolute values
- Solve quadratic equations.

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|--|---|---|---|
| <p><i>Students will be able to:</i></p> <ul style="list-style-type: none"> • Solve equations involving exponents and radicals • Solve simultaneous equation • identify the three cases of solutions of simultaneous equations (a unique solution, no solution, infinitely many solutions) • Solve equations involving absolute value | <p>2. Solution of Equation</p> <p>2.1 Equations involving exponents and radicals (3 periods)</p> <p>2.2 Systems of linear equation two variables. (8 periods)</p> <p>2.3 Equations involving absolute value. (3 periods)</p> | <ul style="list-style-type: none"> • You may start the lesson by the rules for exponents and introduce the fact that for a > 0, $a^x = a^y$ if and only if $x = y$ • Assist students to use the above statement and solve some simple equations involving exponents and radicals. • With active participation of the students revise how to find solution for a linear equation, i.e., equation like $2x + 3 = 7$ and following this discuss with students how the solution of an equation of the form $2x + 3y = 5$ is determined. • Introducing the general form of a system of two linear equations with the help of examples. • Discuss the different methods of finding the solutions of the systems of two linear equations' • Help students them solve the system of simultaneous equations using elimination on substitutions or graphical methods. • You may start the lesson by asking students to state the definition of absolute values. • Assist students to solve equations involving absolute value such as $3x - 2 = 1$ by using the definition of absolute value. | <ul style="list-style-type: none"> • Class activities • Group discussions • Giving Assignment • Give exercise problems on equations involving exponents and radicals like find x <ul style="list-style-type: none"> • $2^x = 8$ • $x^2 = 16$ • $\sqrt{x} = 9$ • Homework • Quiz IX • Give exercise problems on the application of each of the methods for solving system of linear equation. • Give exercise problems on solving equations involving absolute value of linear expression |

|---|---|--|---|
| <ul style="list-style-type: none"> • Solve quadratic equations by using any one of the three methods. • Apply Viète's theorem to solve related problems | <p>2.4 Quadratic equation (8 periods)</p> <ul style="list-style-type: none"> • Solution of quadratic equation using factorization • solution of quadratic equation using completing the square. • Solutions of quadratic equations using the formula. • The relationship between coefficients of quadratic equations and its roots (Viète's theorem) | <ul style="list-style-type: none"> • Introduce the general form of a quadratic equation. • Discuss on the different methods of determining the solutions of quadratic equation. • Help students to find the solutions of a quadratic equation by factorization and by completing the square methods. • Help students find the solutions of a quadratic equation using the general quadratic formula. • Let students practice on the application of Viète's theorem through different exercises. | <ul style="list-style-type: none"> • Give exercise problems on solving quadratic equations (ask the application each method) • Ask students questions about the roots of a given quadratic equations. |

Unit 3: Further on Sets (15 periods)

Unit outcomes: Students will be able to:

- Understand additional facts and principles about sets
- Apply rules of operation on sets and find the result
- Demonstrate correct usage of Venn-diagram in set operations
- Apply rules and principles of set theory to practical situations.

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|--|---|---|--|
| <p><i>Students will be able to:</i></p> <ul style="list-style-type: none"> • describe sets in different ways • identify the elements of a given set • explain the notion "empty set" and "universal set" • determine the numbers of subsets of a given finite set and list them. • give the power set of a given set • determine the number of proper subsets of a given finite set and list them. • distinguishes between equal sets and equivalent sets | <p>3. Further on Sets</p> <p>3.1 Ways to describe sets (2 periods)</p> <p>3.2 The notion of sets (4 periods)</p> | <ul style="list-style-type: none"> • Revise important points from previous grade which discussed about sets and emphasise on how the sets are described • Guide the students to write a set whose elements are related by mathematical formula • After revising what the students know about set description, introduce the new way set builder methods of describing sets, by using several examples. • Assist students to name some elements of a given set and encourage them to explain whether a given object/number belongs to the set or not and to use the appropriate symbol accordingly. • After describing different sets (using either word description, or set builder method) let the student identify which of these set(s) is/are empty set/s • You may start the lesson by introducing what is meant by "universal set" and explain when and how to use it using Venn-diagram in illustration of relations among sets. • Assist students to list and count the number of subsets and proper subsets of some given finite sets (i.e. sets with 1, 2, 3, 4 or 5 elements) and encourage the students to derive general formulas to find the numbers of these subsets and proper subsets. • After explaining the meaning of "equal sets" and "equivalent sets" by using several examples, assist the students to determine equal sets and equivalent sets to a given set. | <ul style="list-style-type: none"> • Ask students to describe a given set in as many ways as possible. • Ask students to give examples of empty sets particularly from practical situations (like: the set of dogs that can fly) • Ask the students to explain the difference among each sets: { }, {x} and {0} • Group discussions on what they had learnt about sets in earlier grades. • Ask students to list all the subsets, power sets and proper subsets of a given finite set. • Give exercise problems on finding equal and equivalent sets to a given set. |

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|---|--|--|--|
| <ul style="list-style-type: none"> find equal sets and equivalent sets to a given set determine number of elements in the union of two finite set. describe the properties of "union" and "intersection" of sets. determine the absolute complement of a given set. determine the relative complement of two sets determine the symmetric difference of two sets. | <p>3.3 Operations on sets (9 periods)</p> <ul style="list-style-type: none"> "union" and "intersection" Complements of a set - De- Morgan's Law Relative complement (difference) of two sets Symmetric difference of two sets | <ul style="list-style-type: none"> Let the students be familiar with the notation used for number of elements in a given finite set. By using some practical examples lead the students to see the relation between the numbers of elements in two finite sets, in their intersection and union. Let the students apply this relation to find the number of elements in the union of two sets using real life examples/ exercises. Use several examples and lead your students to conclude that the commutative and associative properties of "union" and "intersection" of sets hold true. You can start the lesson by defining the notion "absolute complement" of a given set in terms of the universal set and by using Venn diagram let the students become familiar with the concept and its notation. Assist students to determine the absolute complement of a given set. You may use Venn-diagram in your discussion of showing the validity of the De-Morgan's Law and other properties of complements. Define the notion "Relative complement" or "Difference of two sets" using Venn-diagram. Let students determine the relative complement of two set and state some of its properties Lead the students to differentiate between the notions of absolute complement and relative complement. Start the lesson by defining what is meant by "symmetric difference" of two sets. | <ul style="list-style-type: none"> Ask the students to describe the number of elements using mathematical language Ask students to find the union and intersection of sets Ask students to find the number of elements in the union of two sets using both Venn diagrams and formula. Ask students to demonstrate De-Morgan's Law using Venn diagram by means of group work approach Class activities Ask the students to explain the difference between relative complement and absolute complements Ask students to find the relative complement of two given sets. Ask students to describe the symmetric difference of two sets in different ways i.e. |

Mathematics: Grade 9

| <i>Competencies</i> | <i>Contents</i> | <i>Teaching / Learning Activities and Resources</i> | <i>Assessment</i> |
|--|--|---|--|
| <ul style="list-style-type: none"> determine the Cartesian product of two sets. | <ul style="list-style-type: none"> Cartesian product of two sets. | <ul style="list-style-type: none"> Discuss and guide the student to state and explain its properties by using several examples. Define the notion "Product of two sets" and let the students find out its peculiar nature, i.e., the elements of this set are ordered pairs unlike the sets considered so far. Let the students explain which properties are true for the product of two sets and which are not true. Assist the students to see the importance of the Cartesian product of two sets in setting up the coordinate system. | <ul style="list-style-type: none"> $A \Delta B = (A \setminus B) \cup \Delta (B \setminus A)$ $A \Delta B = ((A \cup B) \setminus (A \cap B))$ Ask students to show the commutative and associative properties of "Δ" by giving specific examples. Ask the students to determine whether an ordered pair/s belong to the product of two given sets or not. |

Unit 4: Relations and Functions (22periods)

Unit outcomes: Students will be able to:

- know specific facts about relation and function
- understand basic concepts and principles about combination of functions.
- sketch graphs of relations and functions (i.e. of linear and quadratic functions)

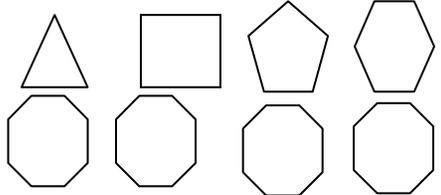

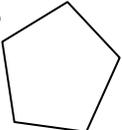

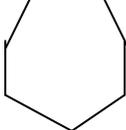

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|---|---|--|--|
| <p><i>Students will be able to:</i></p> <ul style="list-style-type: none"> • define the notions "relation", "domain" and "range" • draw graphs of relations • use graphs of relation to determine domain and range • define function • determine the domain and range of a given function. | <p>4. Relations and Functions</p> <p>4.1 Relations (7 periods)</p> <ul style="list-style-type: none"> • Cartesian product of sets • The Notion "Relation" <p>• Graphs of relations</p> <p>4.2 Functions (6 periods)</p> | <ul style="list-style-type: none"> • You can start the lesson by revising the Cartesian product of two sets. • Assist students to explain the meaning of relation from their daily life. Let them state the formal defining of relation and give examples of relations themselves based on the definition. • You can give some examples of relations and ask students to determine the domain and range • You can start the lesson by discussing with student on how to sketch graphs of relations, like $R = \{(x, y) : y < x\}$ $R = \{(x, y) : y > x + 1\}$ etc. and on determining the domain and range from their graphs. • Assist students to draw graphs of relations of the type. $R = \{(x, y) : y \leq x + 1 \text{ and } y \geq 1 - x\}$. and determine the domain and range. • Allow students to practice writing the rule or formula of a relation from its graph. • You may start the lesson by considering different types of relations. For example $R_1 = \{(a, 1), (b, 2), (c, 3)\}$ $R_2 = \{(a, 0), (b, 0), (c, 0)\}$ $R_3 = \{(a, 1), (a, 2), (a, 3)\}$ and | <ul style="list-style-type: none"> • Ask students to give their own examples of relation taken from their daily life in mathematical language. • Give exercise problems on algebraic relations, and on their domains and ranges. • Give exercises on determining the domain and range of a relation from its graph. • Give exercises on graphing simple linear inequalities • Ask students to write down functions written in the form of ordered pairs |

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|--|---|--|---|
| <ul style="list-style-type: none"> • determine the sum difference, produced and quotient of functions. • Evaluate combination of functions for a given values from their respective domain. • sketch graphs of linear functions • describe the properties of the graphs of linear functions. • sketch the graphs of a given quadratic function. • describe the properties of the graphs of given quadratic functions • determine the maximum and minimum values of a given quadratic function | <ul style="list-style-type: none"> • Combinations of function <p>4.3 Graphs of functions (9 periods)</p> <ul style="list-style-type: none"> • graphs of linear as functions • graphs of quadratic functions | <ul style="list-style-type: none"> • Assist students to observe that types of relations like R_1 and R_2 are function while R_3 is not a function. After considering several examples and discussing them with students state the formal definition of function. • Let students give examples of relations which are functions by themselves. • Assist students to determine the domains and ranges of functions defined by the set of ordered pairs. • You may proceed the lesson by considering functions defined by formulas like. $f(x) = x + 2$ and $g(x) = 3 - 3x$ and guide students to find their sum, difference, product and quotients. Encourage students to determine the relationship between the domains of the component functions and the resulting function. • Assist students to evaluate the sum, difference, product and quotient of functions at a given value of x from the domain. • Define "linear function $y = mx + b$ and quadratic function $y = ax^2 + bx + c$ ($a \neq 0$)" and discuss some basic important properties of each function by using appropriate examples. • You may start the lesson by setting an activity that allows students to construct table of values for given linear and quadratic functions. • Let students sketch the graphs of the given linear and quadratic function whose tables of values are prepared above. • Assist students to describe some of the properties of the graphs of linear and quadratic functions ,the intercepts, the nature of the graphs in relation with the leading coefficients and the coordinates of the vertex of a parabola • Assist students to determine the maximum and minimum values of quadratic function. | <ul style="list-style-type: none"> • Give exercise problems that the students should identify as relations or functions or both and let them give their reason for their answers and let them give the domains and ranges as well.. • Ask students to evaluate the value of a given function at given value from its domain. • Ask students to find combination of simple linear functions, to determine the domain of the resulting function and to find the value of this function at a given value from its domain. • Give exercise problems on sketching the graph of linear and quadratic functions. • Ask students to describe the properties of the graphs of linear and quadratic functions. |

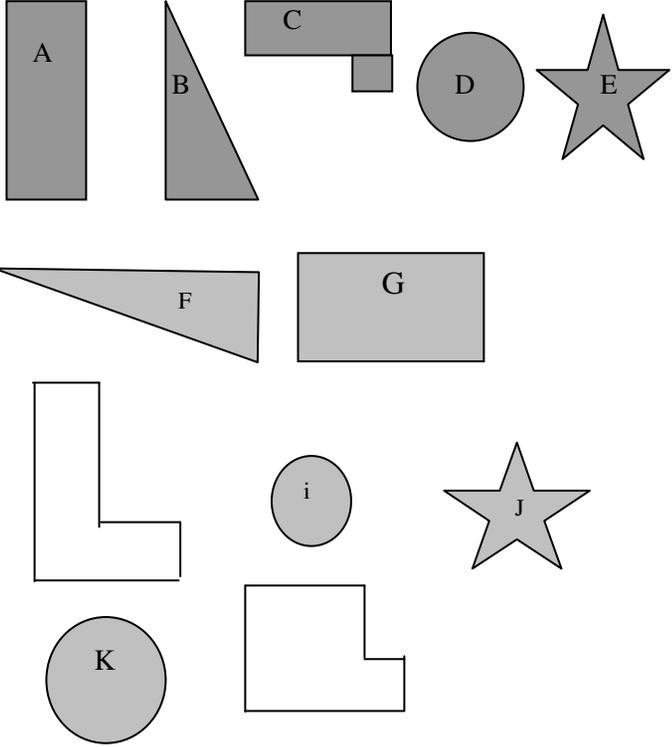

Unit 5: Geometry and Measurement (36 periods)

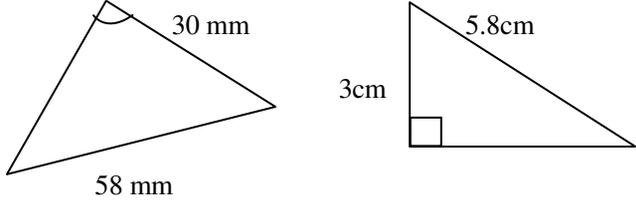

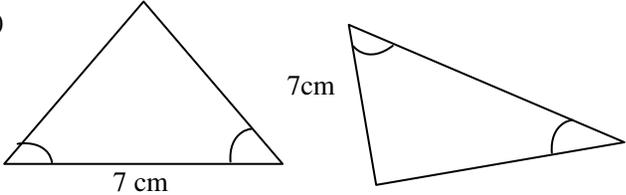

Unit outcomes: Students will be able to:

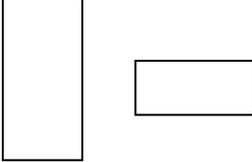

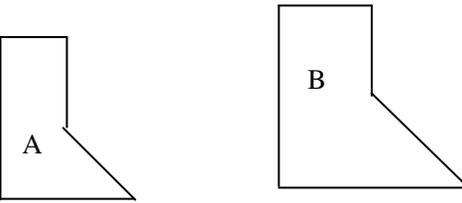

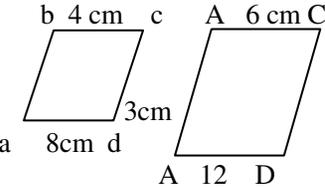

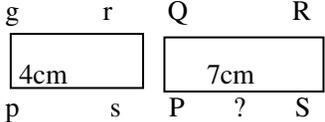

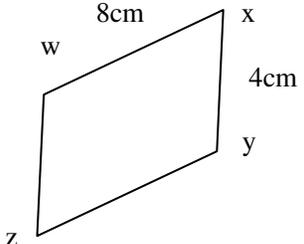

- know basic concepts about regular polygons
- apply postulates and theorems in order to prove congruence and similarity of triangles
- construct similar figures
- apply the concept of trigonometric ratio to solve problems on practical situations
- know specific facts on circles
- solve problems on areas of triangles and parallelograms.

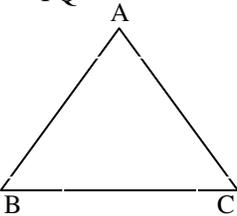

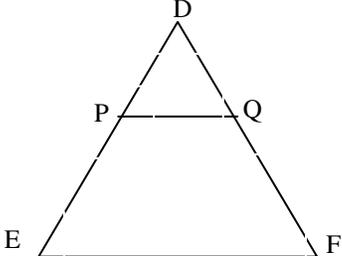

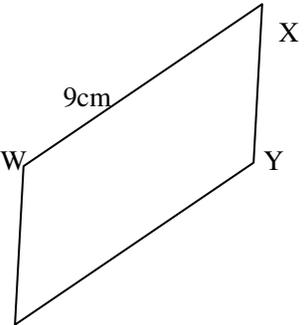

| Competencies | Contents | Teaching / Learning Activities and Resources | Assessment |
|--|---|---|--|
| <p><i>Students will be able to:</i></p> <ul style="list-style-type: none"> • show that the sum of the measures of the interior angles of a triangle is 180° • define a regular polygon and related terms • find the measure of each interior or exterior angle of a regular polygon | <p>5. Geometry and Measurement 5.1 Regular Polygons <i>(5 periods)</i> 5.1.1 Measures of angles of a regular polygon.</p> | <ul style="list-style-type: none"> • It is suggested that the teacher begins this lesson by providing activities to students so that they revise what they have already studied about polygon, then define regular polygon as "a polygon which is equiangular (all angles are congruent) and equilateral (all sides have the same length)" <div data-bbox="905 724 1413 1146" style="border: 1px solid black; padding: 10px; text-align: center;"> <p>Set of regular polygons</p>  <p>Regular polygons</p> </div> <ul style="list-style-type: none"> • Interior angles: The interior angles of a polygon are those angles at each vertex on the inside of the polygon. There is one per vertex. For a polygon with n sides, there are n interior angles. • Let students discover the theorem "the sum of the measures of the angles of a triangle is 180°" by cutting the corners of triangle formed from manila paper and fitting the cutouts to form straight angle. | <ul style="list-style-type: none"> • "Consider each of the following polygons, and show into how many triangles can it be divided by the diagonals from one vertex to the other vertices?" <div data-bbox="1612 760 1896 1182"> <p>a </p> <p>b  c </p> <p>d </p> </div> <ul style="list-style-type: none"> • Give exercise problems on calculation of interior angles and exterior angles of a regular polygon such as: |
